*Counsel for Plaintiff, Kettle Range Conservation Group*

UNITED STATES DISTRICT COURT  
EASTERN DISTRICT OF WASHINGTON

KETTLE RANGE CONSERVATION  
GROUP, a non-profit organization,

*Plaintiff,*

vs.

RODNEY SMOLDEN, in his official  
capacity as Forest Supervisor, Colville  
National Forest; RANDY MOORE, in his  
official capacity as Chief of the U.S. Forest  
Service; UNITED STATES FOREST  
SERVICE, a federal agency; HUGH  
MORRISON, in his official capacity as  
Regional Director for the U.S. Fish and  
Wildlife's Service's Pacific Region;  
MARTHA WILLIAMS, in her official

Case No.

COMPLAINT

capacity as Director of the U.S. Fish and  
Wildlife Service; and UNITED STATES  
FISH AND WILDLIFE SERVICE, a  
federal agency,

*Federal-Defendants.*

## INTRODUCTION

1  
2  
3 1. This case challenges the Forest Service’s controversial decision to authorize  
4 a large-scale logging project in an area deemed essential to the conservation of  
5 threatened Canada lynx (“lynx”) in the lower 48 States.

6 2. The Bulldog project allows mechanized commercial logging, thinning and  
7 fuel treatments, prescribed burning, and related road work on nearly 44,000 acres.  
8 The project also allows for the logging of mature and old growth forest stands,  
9 including large trees. All of this will occur on public lands in the Colville National  
10 Forest’s Kettle Range, which is one of the few and last-remaining areas still occupied  
11 by lynx in the lower 48 States.

12 3. The Kettle Range is considered a stronghold for lynx conservation and an  
13 area critical to the species’ long-term recovery. Lynx numbers have declined, and  
14 continue to decline, in recent years and the species’ range in Washington continues  
15 to contract, mainly due to loss of habitat from logging, wildfires, insect outbreaks,  
16 and climate change. The Kettle Range, however, remains essential to recovery efforts

1 given its relatively high snowshoe hare densities (the lynx’s primary prey) and its  
2 mature, multi-storied mixed conifer forest stands that provide sufficient horizontal  
3 cover needed for foraging and denning. The area is also important for lynx  
4 movement and connectivity, both in the lower 48 States and southern British  
5 Columbia. This is why the Kettle Range was a designated “core area” for lynx  
6 recovery by the U.S. Fish and Wildlife Service and why the Confederated Colville  
7 Tribes and other partners are undertaking a five-year effort to reintroduce additional  
8 lynx into the Kettle Range.

9         4. The Bulldog project – as proposed, however – directly undermines the  
10 Kettle Range’s value for lynx and on-going recovery efforts by displacing lynx from  
11 the area and removing important and essential habitat conditions for lynx over the  
12 next 40 years, perhaps longer. When combined with other logging projects and large  
13 wildfires in the Kettle Range, the Bulldog project makes an already bad situation  
14 worse and may eventually lead to the extirpation of lynx from this area. This, in  
15 turn, would directly undermine lynx recovery efforts in Washington and the lower  
16 48 States.

17         5. In approving the Bulldog project, the Forest Service failed to carefully  
18 consider and analyze the direct, indirect, or cumulative effects to lynx, or prepare an  
19 environmental impact statement (“EIS”) as required by the National Environmental

1 Protection Act (“NEPA”). Nor did the Forest Service evaluate and ensure  
2 compliance with forest plan components designed to conserve lynx habitat as  
3 required by the National Forest Management Act (“NFMA”). The Forest Service and  
4 the Fish and Wildlife Service also failed to properly consult on how the Bulldog  
5 project may affect lynx as required by Section 7 of the Endangered Species Act  
6 (“ESA”).

7 6. Plaintiff, the Kettle Range Conservation Group – a local organization  
8 dedicated to ensuring the ecological integrity of the Kettle Range and the long-term  
9 survival and recovery of lynx in the area – are thus compelled to bring this civil  
10 action.

#### 11 JURISDICTION AND VENUE

12 7. This Court has jurisdiction under 28 U.S.C. § 1331, 16 U.S.C. § 1540(c),  
13 and 5 U.S.C. § 704.

14 8. This Court has the authority to review the Forest Service’s and the Fish and  
15 Wildlife Service’s action(s) and/or inaction(s) complained of herein and grant the  
16 relief requested under 16 U.S.C. § 1540(g) and 5 U.S.C. § 706.

17 9. The Kettle Range Conservation Group has exhausted all available  
18 administrative remedies.

1 10. All requirements for judicial review required by the ESA are satisfied. The  
2 Kettle Range Conservation Group sent the Forest Service and the Fish and Wildlife  
3 Service a valid 60-day notice of intent to sue letter and only filed this case only after  
4 the 60-day notice period had run.

5 11. The relief sought is authorized by 28 U.S.C. § 2201, 28 U.S.C. § 2202, 16  
6 U.S.C. § 1540, and 5 U.S.C. § 706.

7 12. Venue is proper in this Court under 16 U.S.C. § 1540(g)(3)(A) and 28  
8 U.S.C. § 1391(e).

9 13. The Kettle Range Conservation Group has organizational standing. The  
10 organization and its members, supporters, and staff satisfy the minimum  
11 requirements for Article III standing. There is a present and actual controversy  
12 between the Parties.

### 13 PARTIES

14 14. The KETTLE RANGE CONSERVATION GROUP is a rural, grassroots,  
15 non-profit environmental charity formed in 1976 in Republic, Washington. The  
16 organization has roughly 500 members and supporters.

17 15. The Kettle Range Conservation Group's mission is to defend wilderness,  
18 protect biodiversity (including habitat for threatened lynx), and restore ecosystems of  
19 the upper Columbia River Basin. The organization's work includes oversight of  
20 federal management of the Okanogan and Colville National Forests; promotion of

1 dry and damaged forest restoration; environmental education for citizens, business,  
2 and community groups; preservation of wilderness; and protection of fish and  
3 wildlife, including lynx. The organization has a long history of working to protect  
4 and restore threatened and endangered species across the Columbia River Basin,  
5 including lynx.

6 16. The Kettle Range Conservation Group was a founding board member of  
7 the Northeast Washington Forest Coalition, a collaborative organization created in  
8 2002. The collaborative is designed to work with the Forest Service on projects in  
9 the Colville Forest that promote ecological forest restoration, aquatic restoration,  
10 wildland protection, recreation, and economic stability in the surrounding area.  
11 The collaborative has cooperated with the Forest Service on a number of projects  
12 and helped the Forest Service receive funding. The collaborative operates by  
13 consensus. The Kettle Range Conservation Group was compelled to resign from its  
14 board position on the collaborative in April 2022 after the Colville National Forest  
15 pressured other board members to remove its representative.

16 17. The Kettle Range Conservation Group brings this action on behalf of  
17 itself, its members, and its supporters.

18 18. The Kettle Range Conservation Group's staff, members, volunteers, and  
19 supporters have Article III standing to pursue this civil action in their own right, and

1 their interests in conserving the Kettle Range and habitat for lynx and other wildlife  
2 species (at stake in this case) are germane to the organization's purposes.

3 19. The Kettle Range Conservation Group's members, supporters and staff  
4 are dedicated to ensuring our public lands provide sufficient and protected habitat  
5 for wildlife species, including lynx. The organization's members, supporters and staff  
6 are dedicated to ensuring the long-term survival and recovery of lynx in the Kettle  
7 Range, Washington, and the lower-48 States. They are also dedicated to ensuring the  
8 Forest Service and Fish and Wildlife Service comply with the law and ensure all  
9 decisions affecting public lands are well informed and apply the best available  
10 science. The organization's members, supporters and staff understand the  
11 importance of taking a hard look at the environmental effects of agency actions as  
12 required by NEPA and ensuring full compliance with section 7 of the ESA's  
13 consultation provisions.

14 20. The Kettle Range Conservation Group's members, supporters and staff  
15 live near and/or routinely recreate on public lands in the Kettle Range, including  
16 within the project area for the Bulldog project. The organization's members,  
17 supporters and staff enjoy using the area for solitude, hiking, skiing, camping,  
18 backpacking, boating, fishing, and wildlife viewing. They have engaged in these  
19 activities in the past in the project area and intend to do so again in the near future.

1           21. The Kettle Range Conservation Group's members, supporters and staff  
2 gain aesthetic enjoyment from the beauty of the project area for the Bulldog project,  
3 including the old-growth and mature forest stands, subalpine meadows and diverse  
4 riparian areas that would be irreparably impacted by the project. The organization's  
5 members, supporters and staff enjoy observing-or attempting to observe-and  
6 studying lynx, including signs of lynx presence and/or photographing lynx in areas  
7 where the species is known to occur in the Kettle Range and project area. The  
8 opportunity to view wildlife, including lynx and signs of lynx in the wild and in the  
9 area affected by the Bulldog project, by itself is of significant interest and value to  
10 them and increases their use and enjoyment of the action area.

11           22. The Kettle Range Conservation Groups' members, supporters and staff  
12 derive aesthetic, recreational, scientific, inspirational, educational, spiritual, and  
13 other benefits from spending time in the Kettle Range and the project area and  
14 seeing (or trying to see) lynx in the wild, and in working to conserve lynx habitat and  
15 help recover lynx in the Kettle Range, Washington, and the lower 48 States. In  
16 furtherance of these interests, they have worked and continue to work to conserve  
17 wildlife habitat in the Kettle Range, including habitat for lynx and its prey species,  
18 snowshoe hare and red squirrel. Ensuring that the Forest Service and the Fish and  
19 Wildlife Service comply with the law, as alleged in this case, when making important

1 decisions to approve projects like the Bulldog project, is a key component of these  
2 interests.

3 23. The Forest Service's approval of the Bulldog project has harmed, is likely  
4 to harm, and will continue to harm the Kettle Range Conservation Group's interests  
5 in protecting and preserving the Kettle Range and habitat for lynx and other wildlife  
6 species. The organization's interests have been, are being, and, unless the requested  
7 relief is granted, will continue to be harmed by the Bulldog project.

8 24. If this Court issues the relief requested, the harm to the Kettle Range  
9 Conservation Group's interests will be alleviated and/or lessened.

10 25. Federal-Defendant RODNEY SMOLDEN is sued in his official capacity as  
11 Forest Supervisor for the Colville National Forest. As Forest Supervisor, Mr.  
12 Smolden is the federal official with responsibility for all Forest Service officials'  
13 actions and/or inactions challenged in this case.

14 26. Federal-Defendant RANDY MOORE is sued in his official capacity as  
15 Chief of the U.S. Forest Service. As Chief, Mr. Moore is the federal official with  
16 responsibility for all Forest Service officials' actions and/or inactions challenged in  
17 this case.

18 27. Federal-Defendant UNITED STATES FOREST SERVICE ("Forest  
19 Service") is an agency within the United States Department of the Agriculture that is

1 responsible for applying and implementing the federal laws and regulations  
2 challenged in this case.

3 28. Federal-Defendant HUGH MORRISON is sued in his official capacity as  
4 Regional Director for the United States Fish and Wildlife Service’s Pacific Region,  
5 which includes Washington. As Regional Director, Mr. Thompson is the federal  
6 official with responsibility for all Fish and Wildlife Service officials’ actions and/or  
7 inactions challenged in this case.

8 29. Federal-Defendant MARTHA WILLIAMS is sued in her official capacity  
9 as Director of the United States Fish and Wildlife Service. As Director, Ms.  
10 Williams is the federal official with responsibility for all Fish and Wildlife Service  
11 officials’ actions and/or inactions challenged in this case.

12 30. Federal-Defendant UNITED STATES FISH AND WILDLIFE SERVICE  
13 (“Fish and Wildlife Service”) is an agency within the United States Department of  
14 the Interior that is responsible for applying and implementing the federal laws and  
15 regulations challenged in this case.

## 16 BACKGROUND

### 17 *Lynx*

18 31. Lynx are medium-sized cats with long legs and large, well furred paws and  
19 webbed toes. Lynx have a lower foot loading and longer limb length (compared to

1 bobcats) with large feet that are specifically adapted to travel through deep, fluffy  
2 snow conditions which give the species a competitive advantage over other species.

3  
4 32. Lynx are habitat specialists that depend on mature, multi-story forest  
5 stands with dense horizontal cover. Lynx occur primarily in spruce-fir vegetation  
6 types that receive persistent snowfall. Sufficient horizontal cover is an important  
7 feature for lynx habitat. Lynx habitat in the West is dominated by stands of mixed  
8 conifer, including Engelmann spruce, subalpine fir, and lodgepole pine.

1           33. Lynx are prey specialists, relying almost exclusively on snowshoe hare.

2 Forest structure that provides dense horizontal cover is a common characteristic of  
3 snowshoe hare habitat. Dense horizontal cover provides cover from predators,  
4 thermal protection, and adequate forage. In Washington, snowshoe hare habitat  
5 typically includes areas with dense, horizontal cover at least 3-10 feet above the  
6 ground or snow level.

7           34. Snowshoe hares are the primary prey for lynx. The percentage of lynx diet  
8 composed of snowshoe hare varies by geography across their range. Snowshoe hare  
9 comprise between 35-97% of lynx diet in different places throughout the species'  
10 range. The summer diet of lynx may include greater diversity of prey species than in  
11 winter, due to the greater seasonal availability of prey. Other food sources include  
12 red squirrels, ground squirrels, grouse, mice, porcupine, beaver, voles, weasels, and  
13 shrews.

14           35. Red squirrels are an important secondary food source for lynx. Red  
15 squirrels are an alternate prey during periods of low snowshoe hare abundance. Red  
16 squirrels rely on mixed conifer forest habitats, including fir, pine, and spruce. Red  
17 squirrels feed, nest and breed in trees. Red squirrels need a large amount of forest to  
18 survive. Changes to either the type of tree or the design of the woodland can  
19 negatively affect populations of red squirrels.

1           36. Lynx survival and distribution is influenced by snow conditions. Lynx  
2 survival and distribution is generally restricted to areas that receive deep powdery,  
3 and persistent snow that allows lynx to outcompete other terrestrial hare predators  
4 that are less efficient in such conditions. Lynx are highly adapted to environments  
5 that receive considerable winter snow.

6           37. Lynx and snowshoe hares only persist in areas with long winters and  
7 persistent deep snow. Snow depth and the distribution of snowshoe hares are the  
8 strongest predictors of where lynx select their home ranges. Lynx are adapted to cold  
9 environments. Lynx are sensitive to changes in snow depth. The lynx's adaptations  
10 allow them to occupy habitats that are generally unavailable to other species during  
11 the winter months.

12           38. Lynx natal and maternal den sites are used until kittens reach about 6-8  
13 weeks of age. For denning habitat to be functional, it must be in, or adjacent to,  
14 foraging habitat. Common components of natal and maternal den sites are large  
15 woody debris (root wads and downed logs) and dense horizontal cover.

16           39. The average home range for lynx is 5-10 hectares (12-25 acres). Daily  
17 movements of lynx within their home ranges are centered on continuous forests.  
18 Lynx generally avoid large openings (both natural and created) when moving  
19 through their home ranges.

1 40. The vast majority of the lynx's habitat and range is in Canada and Alaska.

2 41. Lynx in the lower 48 States are part of a meta-population with a core  
3 population located in Canada. A meta-population is a network of semi-isolated  
4 subpopulations, each occupying a suitable patch of habitat in a landscape of  
5 otherwise unsuitable habitat. Meta-populations require some level of regular or  
6 intermittent migration and gene flow among subpopulations, in which individual  
7 populations support one another by providing genetic and demographic enrichment  
8 through mutual exchange of individuals. Individual subpopulations may go extinct  
9 or lose genetic viability, but are then rescued by immigration from other  
10 subpopulations, thus ensuring the persistence of the meta-population.

11 42. In the lower 48 States, lynx historically occurred in:

12 (1) the Cascades Range of Washington and Oregon; (2) the Rocky Mountain region  
13 of in Montana, Wyoming, Idaho, eastern Oregon, eastern Washington, northern  
14 Utah, Colorado, and northern New Mexico; (3) the western Great Lakes region; and  
15 (4) the northeastern United States region from Maine southwest to New York.

1 Figure 8.17—Spatial distribution of lynx occurrence data from 1842 to 1998 (Table 8.1).

2 43. Lynx population numbers in the lower 48 States are naturally lower than  
3 populations in Canada.

4 44. Lynx in the lower 48 States were subject to exploitation and over-trapping  
5 during the 1960s, 1970s, and 1980s in response to high pelt prices. From the mid-  
6 1970s until the late 1980s, lynx pelts were at record highs in the lower 48 States and  
7 Canada. Lynx pelt prices peaked in the mid-1980s at nearly \$500 per pelt and  
8 remained above \$200 per pelt for 12 years until 1989.

9 45. Lynx experienced significant population declines in the lower 48 States in  
10 the 1980s and 1990s. Lynx experienced significant population declines in  
11 Washington in the 1970s and 1980s. A number of states, including Washington,

1 prohibited lynx trapping in response to declining population numbers.

2 ***Lynx receive protected status as a threatened species under the ESA***

3 46. In January 2000, the Fish and Wildlife Service prepared a Lynx  
4 Conservation Assessment and Strategy (“2000 Lynx Assessment”) to evaluate and  
5 inform whether lynx in the lower 48 States should be protected as a threatened  
6 species under the ESA.

7 47. The 2000 Lynx Assessment identified a number of risk factors for lynx.  
8 The 2000 Lynx Assessment identified timber and logging projects as a risk factor for  
9 lynx. The 2000 Lynx Assessment identified wildland fire as a risk factor for lynx. The  
10 2000 Lynx Assessment identified recreation in areas occupied by lynx as a risk factor  
11 for lynx. The 2000 Lynx Assessment identified human development as a risk factor  
12 for lynx.

13 48. The 2000 Lynx Assessment identified a number of factors affecting lynx  
14 mortality (trapping, predator control, incidental shooting, highways), lynx movement  
15 (highways and private land development), and other large-scale risk factors, including  
16 loss of connectivity and habitat fragmentation. The loss of connectivity and habitat  
17 fragmentation breaks down meta-population dynamics.

18 49. In March 2000, the Fish and Wildlife Service listed lynx as a threatened  
19 distinct population segment in the lower 48 States under the ESA.

1 50. The March 2000 listing was premised on the findings included in the  
2 2000 Lynx Assessment.

3 51. The Fish and Wildlife Service determined that lynx were likely to become  
4 endangered in the foreseeable future throughout all, or a significant portion, of its  
5 range in the lower 48 States.

6 52. The Fish and Wildlife Service identified the loss of foraging and denning  
7 habitat from logging, fire, and insects (bark beetle, bug worm) as a threat to lynx.  
8 The Fish and Wildlife Service identified habitat fragmentation as a threat to lynx.  
9 The Fish and Wildlife Service identified mortality from predation, vehicle collisions,  
10 trapping (incidental) as a threat to lynx. The Fish and Wildlife Service identified  
11 climate change as a threat to lynx.

12 53. In 2013, the Fish and Wildlife Service's Interagency Lynx Biology team  
13 updated and revised the 2000 Lynx Assessment.

14 54. The 2013 Lynx Assessment recognizes four "first tier" anthropogenic  
15 threats to lynx that are "of greatest concern" to the conservation of lynx. These first-  
16 tier threats include: (1) climate change which is likely to shift the distribution of lynx  
17 north, result in changes to snowshoe hare cycles, reduce the amount of available  
18 lynx habitat and population size, alter demographic rates, and change predator-prey  
19 relationships; (2) vegetation (timber) management; (3) wildland fire management;

1 and (4) habitat fragmentation.

2 55. The 2013 Lynx Assessment identified “second tier” anthropogenic threats  
3 to lynx. These second-tier threats include: (1) incidental trapping and illegal  
4 shooting; (2) recreation, including winter recreation and new roads and trails; and  
5 (3) energy projects and grazing.

6 56. In October 2017, the Fish and Wildlife Service released a Species Status  
7 Assessment (“2017 Status Assessment”) for lynx.

8 57. The 2017 Status Assessment was prepared by a lynx “core team” and other  
9 staff. The 2017 Status Assessment relies on the input and professional opinions  
10 provided during an Expert Elicitation Workshop and information contained in the  
11 2013 Lynx Assessment. The 2017 Status Assessment is considered the most up-to-  
12 date and best available science on lynx and threats to the species.

13 58. In the 2017 Status Assessment, the Fish and Wildlife Service recognized  
14 climate change as the most serious threat to lynx conservation and recovery in the  
15 lower 48 States. The 2017 Status Assessment states that it expects that “resident  
16 population sizes and distributions in the [lower 48 States] will likely decline largely as  
17 a result of projected continued climate warming and associated impacts, which are  
18 likely to exacerbate the potential adverse effects of other stressors.”

1           59. The 2017 Status Assessment states that while the “timing and extent of  
2 climate-mediated impacts are uncertain, continued warming is expected to cause a  
3 northward and upslope contraction of the boreal forest, snow conditions, and hare  
4 populations that support lynx, along with several other potential impacts.” The 2007  
5 Status Assessment states that this in turn will “result in smaller, more fragmented,  
6 and more isolated lynx populations [in the lower 48 States] that would be more  
7 vulnerable to stochastic demographic and catastrophic events and genetic drift.”

8           60. The 2017 Status Assessment states that climate change has and continues  
9 to adversely impact lynx in the lower 48 States, including Washington. The 2017  
10 Status Assessment states that climate warming has and will continue to reduce snow  
11 amount, duration and quality (conditions favorable to lynx) and will likely result in  
12 increased size, frequency, and severity of wildfires and insect outbreaks in lynx  
13 habitat. Climate change may also cause changes in snowshoe hare population cycles  
14 and disrupt connectivity between subpopulations in the lower 48 States, and  
15 between lynx in Canada and the lower 48 States. Climate change has increased the  
16 size, frequency, and severity of wildfires in lynx habitat.

17           ***“Core areas” for lynx recovery in the lower 48 States***

18           61. In 2005, the Fish and Wildlife Service prepared a recovery outline for  
19 lynx.

1           62. The lynx recovery outline guides all recovery efforts for the Fish and  
2 Wildlife Service until a final recovery plan for lynx is prepared. The recovery  
3 outlines the agency’s vision for conserving the species in the lower 48 States in the  
4 face of various threats.

5           63. The Fish and Wildlife Service said the recovery outline presents its  
6 understanding of historical and current lynx distribution, ecology, population  
7 dynamics, and the relative importance of different geographic areas to the  
8 persistence of lynx in the lower 48 States.

9           64. In the lynx recovery outline, the Fish and Wildlife Service identified six  
10 “core areas” for lynx recovery in the lower 48 States. “Core areas” for recovery are  
11 areas that have: (1) verified evidence of long-term historical and current presence of  
12 lynx populations; (2) recent (within the past 20 years) evidence of reproduction; (3)  
13 contain boreal forest vegetation types of sufficient quality and quantity to support  
14 lynx and snowshoe hares; and (4) snow conditions that are generally fluffy and/or  
15 deep enough to favor the lynx’s competitive advantage.

16           65. The “core areas” for lynx recovery identified by the Fish and Wildlife  
17 Service for lynx include: (1) Northern Maine and New Hampshire; (2) Northeastern  
18 Minnesota; (3) Northwestern Montana and Northeastern Idaho; (4) Washington’s  
19 Kettle Range/Wedge; (5) North Cascades; and (6) Greater Yellowstone Areas.

## Figure 1: Canada Lynx Recovery Areas

Preliminary

66. The Fish and Wildlife Service outlined four recovery objectives for lynx in these core areas: (1) retain adequate habitat of sufficient quality to support long-term persistence of lynx populations in identified “core” areas; (2) ensure sufficient habitat is available to accommodate long-term persistent of movement between each core area and adjacent populations in Canada or secondary areas; (3) ensure that habitat in secondary areas remains available for lynx occupancy; and (4) ensure that all threats are addressed so that lynx will persist in the contiguous United States “for at least the next 100 years.”

67. The Fish and Wildlife Service outlined seven specific actions (several with multiple parts) needed to achieve the four recovery objectives in the six “core areas”. These actions include: (1) establishing management commitments in all core areas;

1 (2) maintaining baseline inventories of lynx habitat in each core area; (3) monitoring  
2 lynx use in core areas; (4) identifying habitat to facilitate movement between core  
3 areas; (5) ensuring that habitat in all secondary areas remain available for lynx; (6)  
4 identifying population and habitat limiting factors for lynx; and (7) developing a  
5 post-delisting monitoring plan for lynx.

6 ***Washington's "core areas" for lynx recovery***

7 68. Washington is part of the lynx's historic range. Washington is occupied by  
8 a number of lynx subpopulations.

9 69. Verified records of lynx in Washington, including reproduction, are  
10 numerous and well-distributed since the late 1800s. According to trapping records,  
11 trappers regularly took a dozen or more lynx from remote areas in north-central and  
12 northeastern Washington each year in the 1940s.

13 70. Trapping for lynx in Washington was prohibited in 1991 due to declining  
14 numbers. Lynx are sometimes caught in traps set for other species, including  
15 bobcats. Trapping in southern British Columbia, Canada is limiting the  
16 immigration and movement of lynx from Canada into Washington.

17 71. In 1993, Washington Department of Fish and Wildlife ("WDFW")  
18 published a report entitled Status of the North American Lynx (*Lynx Canadensis*) in  
19 Washington. In the 1993 lynx report, WDFW estimated the state's lynx population

1 to be between 96-191 individuals. In the 1993 report, WDFW explained that the  
2 current range of lynx in Washington was largely limited to six areas: the Okanogan,  
3 Vulcan Mountain, Kettle Range, Wedge, Little-Pend Oreille, and Salmo-priest  
4 regions in north-central and northeastern Washington.

5 72. In the 1993 report, WDFW raised concerns about the loss of lynx  
6 numbers and habitat due to past logging and habitat alternations and past trapping  
7 pressure on the species. WDFW's trapping records reveal at least 215 lynx were  
8 trapped in killed in Washington between 1960 and 1991.

9 73. In 1993, Washington listed lynx as a "threatened" species under state law.

10 74. In 2001, WDFW prepared a final report and recovery plan for lynx in  
11 Washington.

12 75. The 2001 lynx recovery plan for Washington includes maps of all lynx  
13 analysis units ("LAUs") in Washington. A LAU is the approximate size of a female's  
14 home range. WDFW says it uses LAUs to report survey data and to analyze the  
15 condition of lynx habitat.

16 76. In 2006, the Washington State Department of Natural Resources  
17 ("DNR") published a Lynx Habitat Management Plan for all DNR managed lands in  
18 Washington. Washington DNR manages more than 5 million acres of state land in  
19 Washington. The 2006 Lynx Habitat Management Plan replaces Washington DNR's

1 previous 1996 plan. Washington DNR manages roughly 4 percent of the lynx  
2 habitat in Washington.

3 77. In 2006, WDFW published a paper entitled *Lynx in the State of Washington*  
4 which included a map depicting recent lynx occurrence in Washington by LAU and  
5 region.

6 78. In 2016, WDFW published a status review of lynx in Washington. Due to  
7 the amount of range contraction for lynx in Washington, the loss of lynx habitat in  
8 Washington (due to fires and logging), and ongoing threats from climate change,  
9 WDFW recommended uplisting lynx from “threatened” to “endangered” status  
10 under state law.

11 79. In 2016, Washington uplisted lynx from “threatened” to “endangered”  
12 state status.

13 80. Washington is divided into six lynx management zones based on historic  
14 lynx data and habitat. The six lynx management zones in Washington include: (1)  
15 Okanogan; (2) Vulcan-Truck; (3) Kettle Range; (4) the Wedge; (5) Little Pend  
16 Oreille; and (6) Salmo-Priest.

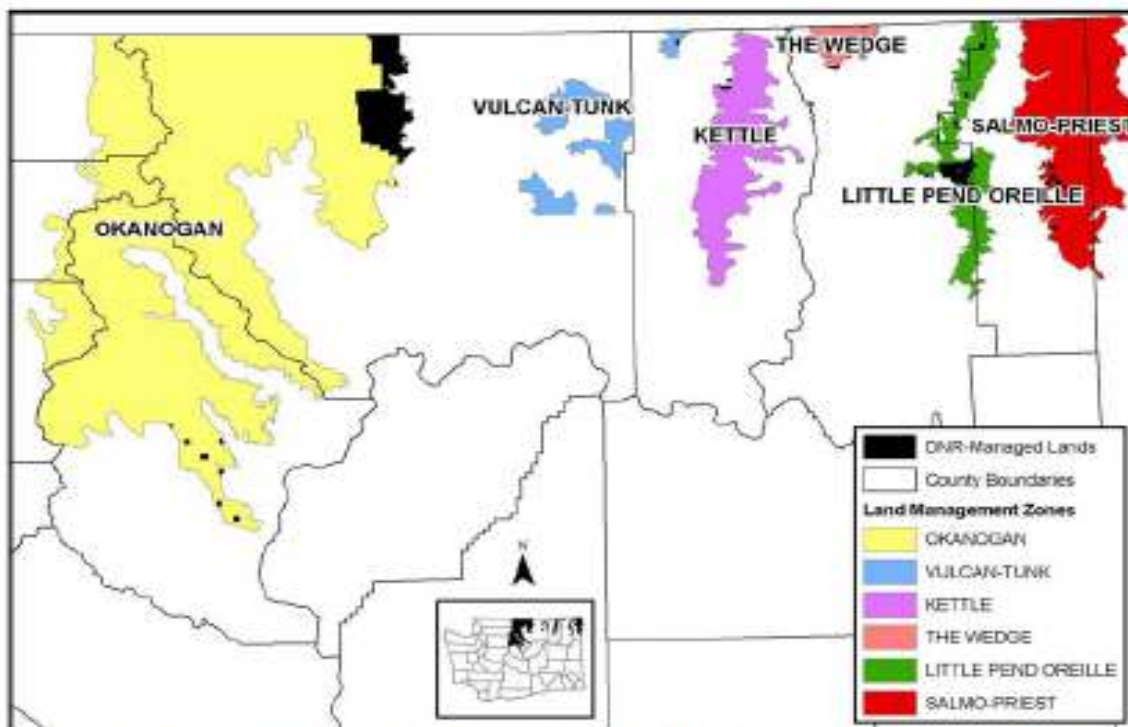

Figure 2. Lynx management zones (LMZs) in Washington indicate the general areas historically occupied by lynx in northcentral and northeastern Washington.

1

2 *The Kettle Range management zone and “core area” for lynx recovery*

3 81. WDFW designated the Kettle Range a lynx management zone. The Fish  
 4 and Wildlife Service designated the Kettle Range a “core area” for lynx recovery.

5 82. The Kettle Range is the southernmost range of the Monashee Mountains,  
 6 located in far southeastern British Columbia, Canada, and northeastern  
 7 Washington. The Kettle Range provides contiguous habitat between Washington  
 8 and British Columbia.

1

2

3

4

5

6

83. The Kettle Range forms the eastern and southern boundary for Ferry County, Washington. Most of the northern half of the Kettle Range is located in Colville National Forest and managed by the Forest Service. The southern half of the Kettle Range is located on the Colville Indian Reservation and managed by the Confederated Tribes of the Colville Reservation.

7

8

9

84. The Kettle Range is occupied by wolverine. The Kettle Range is occupied by gray wolves. The Kettle Range used to be occupied by caribou. The Kettle Range is occasionally occupied by grizzly bears.

10

11

85. The Kettle Range is occupied by lynx. There is evidence of lynx reproduction in the Kettle Range. Lynx were routinely trapped and killed in the

1 Kettle Range. The Kettle Range was considered a stronghold for lynx.

2 86. The Kettle Range contains good lynx habitat. The Kettle Range includes  
3 boreal forest landscapes with sufficient snowshoe hare densities and winter snow  
4 which make it ideal for lynx. There are large expanses of subalpine fir forests in the  
5 Kettle Range. The forests in the Kettle Range are primarily Northern Rocky  
6 Mountain mixed conifer. The forests in the Kettle Range were historically comprised  
7 of mature, dense stands of mixed conifers with sufficient horizontal cover which are  
8 ideal for lynx. Historically, forest stands in the Kettle Range were not open and  
9 widely spaced dry forest stands. This picture was taken from the Jackknife Mountain  
10 lookout in September 1934 in the Kettle Range:

11  
12 87. Forest stands in the Kettle Range experience winter conditions with deep  
13 snow for extended periods of time. Forest stands in the Kettle Range include sites

1 for denning such as downed trees and root wads. The Kettle Range includes matrix  
2 habitat allowing lynx to travel between patches of boreal forest.

3 88. From 1981 to 1988, WDFW tracked 30 lynx with radio-telemetry in  
4 north-central Washington, including in the Kettle Range. Three of the tracked lynx  
5 gave birth to kittens in the Kettle Range.

6 89. WDFW determined the Kettle Range contains the second-largest block of  
7 lynx habitat in Washington. Between 400 and 987 square kilometers of suitable lynx  
8 habitat is present in the Kettle Range. WDFW estimates the Kettle Range is capable  
9 of supporting a population of roughly 23 lynx.

10 90. Biologists estimate the Kettle Range contains relatively high densities of  
11 snowshoe hares, approximately 0.6-3.6 hares/hectare. According to WDFW “habitat  
12 conditions in the Kettle Range appear adequate to support lynx as demonstrated by  
13 estimates of relatively high hare densities (0.6-3.6 hares/ha).”

14 91. WDFW determined the Kettle Range contains quality habitat essential to  
15 lynx conservation. WDFW recommended the Kettle Range be included in  
16 designated lynx critical habitat.

17 92. Historically, the Kettle Range is responsible for the highest levels of lynx  
18 take in Washington. Lynx were once considered numerous in the Kettle Range.

1 93. During the peak of 1969, 26 of the 31 lynx trapped and killed in  
2 Washington were from the Kettle Range in Ferry County. In 1975, 14 of 19 lynx  
3 taken in Washington came from the Kettle Range. In 1976, 17 of 39 taken in  
4 Washington came from the Kettle Range.

5 94. In a 1993 report, WDFW reported that the Kettle Range was responsible  
6 for the highest lynx take in Washington. During one trapping season in the mid-  
7 1970s, two local trappers reported taking 35 lynx in the Kettle Range alone.

8 95. Approximately thirty-five percent of all lynx trapping records from  
9 Washington - 82 individual lynx - are from the Kettle Range. The neighboring  
10 Okanogan Range to the west of the Kettle Range accounted for twenty percent of all  
11 lynx trapping records and neighboring Stevens County to the east of the Kettle  
12 Range accounted for ten percent of lynx trapping records.

13 96. Lynx were considered to be present and reproducing in the Kettle  
14 Mountains well into the 1970s, but biologists surmise the local population was likely  
15 over-trapped. A trapper from Ferry County stated that he trapped and killed 23 lynx  
16 in a single year in the Kettle Range during his best year in the mid-1970s.

17 97. The location of the Kettle Range is important for lynx because it provides  
18 connectivity between lynx in the lower 48 States and lynx in Canada. The Kettle  
19 Range provides connectivity between sub-populations of lynx in the lower 48 States.

1 The Kettle Range is an important linkage area for lynx. Lynx frequently travel  
2 through the Kettle Range as they travel to/from British Columbia and across the  
3 international boundary with Canada.

4 98. Modeling for lynx habitat connectivity in Washington identified viable  
5 connectivity between the North Cascades, the Kettle Range and the Wedge, and the  
6 Northern Rocky Mountains and Canada.

7 99. The Kettle Range is designated as occupied lynx habitat by the Forest  
8 Service.

9 100. In 2000, the Kettle Range contained the second largest block of lynx  
10 habitat in Washington. In 2000, the Kettle Range was considered a “stronghold for  
11 lynx” in Washington. In 2000, the Kettle Range supported a resident, breeding  
12 population of lynx.

13 101. In 2001, WDFW prepare a recovery plan for lynx in Washington. In the  
14 2001 recovery plan, WDFW mapped all LAUs in the Kettle Range.

15 102. WDFW’s 2001 lynx recovery plan documents evidence of lynx  
16 occupancy in the Kettle Range. Based on verified data collected from annual lynx  
17 surveys which included snow tracking, automated camera sets, and hair snares  
18 conducted in six “lynx management zones” - including the Kettle Range - WDFW  
19 noted that it routinely documented lynx presence in the Kettle Range. This includes

1 confirmed lynx tracks in the Kettle Range in 1989, 1990, 1991, 1994, 1997 and  
2 2000, as well as “other unconfirmed, but considered highly likely report of lynx in  
3 the Kettle Range” from 1996, 1997 and 2000.

4 103. In 2001, WDFW considered at least a third of the Kettle Range  
5 occupied by lynx. The state wildlife agency estimated that approximately 8 to 12 lynx  
6 likely inhabit the Kettle Range. WDFW noted that lynx likely have not recovered  
7 from the intense trapping periods of the 1970s and 1980s and that they could “find  
8 only a couple of records suggesting lynx kitten production in the Kettle Range in  
9 2000.

10 104. WDFW noted that a knowledgeable local trapper (Bert Edwards) tracked  
11 a juvenile lynx in 1993 suggesting that reproduction may have occurred in the Kettle  
12 Range at that time. WDFW explained that snow-tracking routes in the Kettle Range  
13 are not sampled annually, and any particular segment of the route may only be  
14 sampled every 3 years. WDFW noted that the survey routes do not traverse the  
15 highest lynx habitat in the Kettle Range, so if lynx are present, they may not be  
16 detected.

17 105. In 2005, the Fish and Wildlife Service designated the Kettle Range as a  
18 “core area” for lynx recovery in the lower 48 States.

1           106. The Fish and Wildlife Service designated the Kettle Range as a “core  
2 area” due to its available lynx habitat, snowshoe hare densities, and the verified  
3 presence of lynx in the area. “Core areas” are areas with the strongest long-term  
4 evidence of persistence of lynx populations within the lower 48 States.

5           107. In 2006, Dr. Keith Aubry, PhD Wildlife Biologist submitted comments  
6 to the Fish and Wildlife Service recommending the Kettle Range be included in a  
7 proposed rule designating critical habitat for lynx in the lower 48 States.

8           108. Dr. Aubry explained that the Kettle Range includes large expanses of  
9 subalpine fir forests and a very strong historical record of lynx occurrence. Dr. Aubry  
10 explained that protecting habitat for lynx in the Kettle Range would be particularly  
11 important for the conservation of the species in the lower 48 States. Dr. Aubry  
12 explained that the Kettle Range is located about midway between extant resident  
13 populations in the northern Cascade Range in Washington and the northern Rocky  
14 Mountains in Idaho and Montana and provides important habitat connectivity  
15 between these populations.

16           109. In 2007, WDFW updated its lynx surveys based on additional lynx  
17 detections throughout the State. Based on the historic records, track surveys, and the  
18 additional detections, WDFW said it was confident the Kettle Range is “occupied”  
19 by lynx. WDFW said that while detections of lynx have been limited and sporadic in

1 the Kettle Range, it continued to receive sporadic detections of lynx in the Kettle  
2 Range, including in 2007.

3 110. WDFW stated that while the Fish and Wildlife Service notes that snow-  
4 tracking surveys from 1992-1996 resulted in only 2 lynx detections, the state agency  
5 has received 26 records of lynx in the Kettle Range between 1990 and 2007. WDFW  
6 said most of these detections were made by knowledgeable individuals including  
7 Bert Edwards, who trapped the area for over 40 years and caught many of the lynx in  
8 the Kettle Range in the 1970s.

9 111. In 2008, WDFW “strongly” recommended that the Kettle Range be  
10 designated lynx critical habitat. WDFW said it considers the Kettle Range to be  
11 “occupied” by lynx and routinely receives detections of lynx in the area.

12 112. In 2008, WDFW said present habitat conditions in the Kettle Range are  
13 adequate to support lynx as demonstrated by estimates of relatively high hare  
14 densities (0.6-3.6 hares/ha) in younger forest stands that have regenerated from both  
15 timber harvest and wildfires.

16 113. In 2008, WDFW said it was aware of a fence at the northern end of the  
17 Kettle Range in British Columbia, Canada that was installed to prevent vehicle  
18 collisions with bighorn sheep and deer in a major highway corridor. WDFW said  
19 this fence may create an obstacle for lynx dispersal and re-colonization in the Kettle

1 Range.

2 114. WDFW said it considers the Kettle Range to be “essential to the  
3 conservation of lynx.”

4 115. In 2008, Gary Koehler, wildlife biologist and researcher, recommended  
5 the Kettle Range be designated as critical habitat for lynx. Koehler said sufficient  
6 habitat exists in the Kettle Range to support lynx. Koehler said that climate change  
7 and the increase in wildfires places greater importance on the Kettle Range for the  
8 conservation of lynx. Koehler said that ensuring lynx remain in the Kettle Range will  
9 help ensure “redundancy” of lynx populations in Washington and the lower 48  
10 States which is needed for long-term viability and conservation.

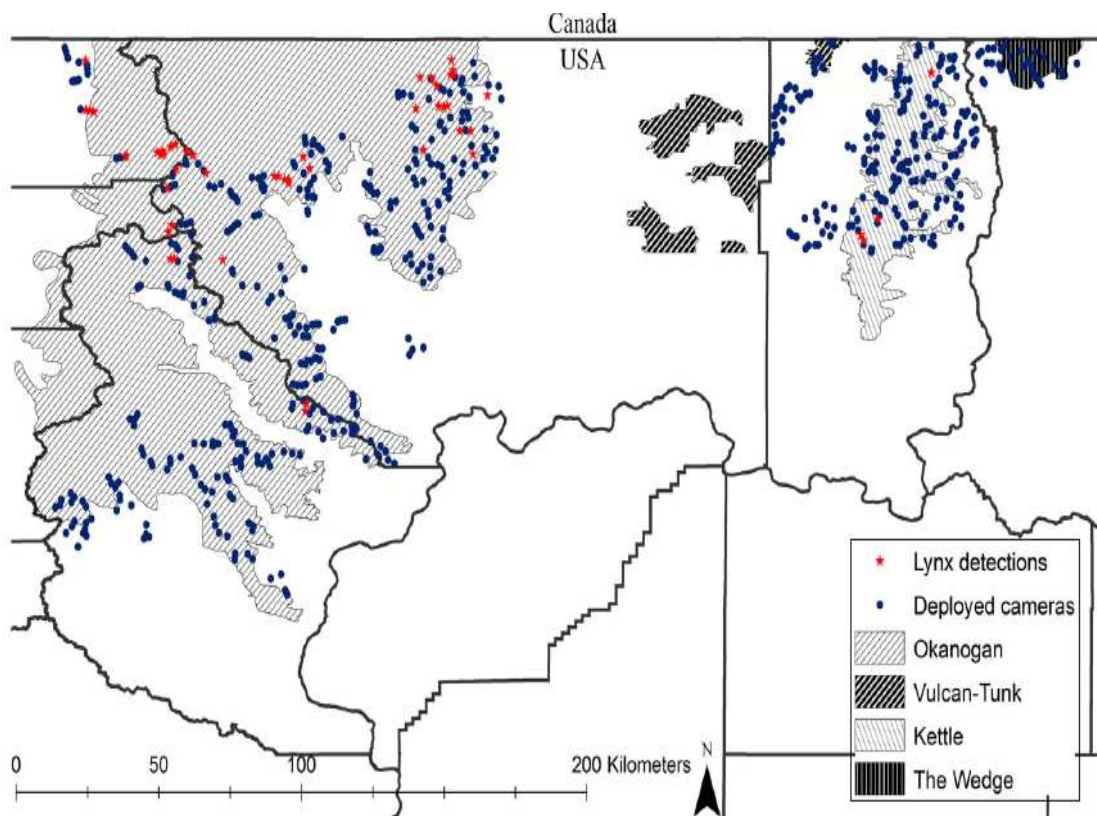

11 116. In 2008, Koehler published a paper entitled *Habitat Fragmentation and*  
12 *Persistence of Lynx Populations in Washington State* (“Koehler (2008)”). Koehler (2008)  
13 mapped suitable lynx habitat in the Kettle Range. Koehler (2008) mapped the extent  
14 of lynx habitat composed on Engelmann spruce and subalpine fir forests with  
15 canopy cover from 11-39 percent and elevations ranging from 1,525 meters to 1,828  
16 meters in the Kettle Range. Koehler (2008) estimated that the Kettle Range could  
17 support 10-23 lynx. Koehler (2008) recommended conducting a feasibility study to  
18 explore reintroducing lynx to the Kettle Range.

1           117. In 2014, the Fish and Wildlife Service agreed that the Kettle Range was  
2 historically occupied by lynx and that lynx still inhabited the range.

3           118. In 2014, WDFW recommended the Fish and Wildlife Service once again  
4 consider designating the Kettle Range as lynx critical habitat. WDFW said the Kettle  
5 Range is important for lynx in the lower 48 States because it supports movement  
6 between larger areas of habitat in the Cascades and Selkirks. WDFW said that a  
7 reproducing population lynx may be reestablished in the Kettle Range either  
8 through immigration (most likely from Canada) or through reintroduction.

9           119. A 2019 habitat feasibility study identified the Kettle Range as an  
10 important area for lynx recovery efforts, in part, because it is geographically  
11 connected to lynx populations in Canada.

12           120. In 2020, King et al. published a paper entitled *Will Lynx Lose Their Edge?*  
13 *Canada Lynx Occupancy in Washington* (“King (2020)”). King (2020) documented the  
14 presence of lynx in the Kettle Range based on camera stations that were placed in  
15 the range during the summers of 2016 and 2017.

1  
2 121. King (2020) determined that lynx in Washington may be particularly  
3 vulnerable to climate change.

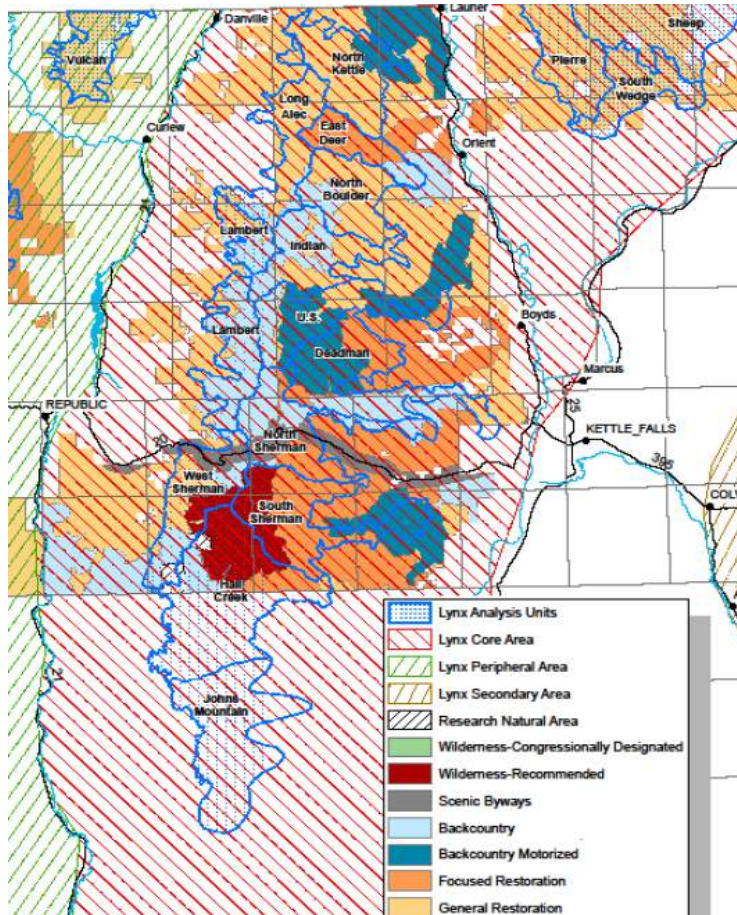

4 122. King (2020) determined that maintaining the greatest quantities of lynx  
5 habitat at high elevations in places where favorable snow conditions may persist like  
6 the Kettle Range is important for lynx resilience.

7 123. King (2020) documented the importance of maintaining connectivity  
8 between lynx populations in Canada and those in Washington, including the Kettle  
9 Range.

10 124. The Colville National Forest Land and Resource Management Plan  
11 (“forest plan”) was revised in 2019.

1           125. The forest plan includes forest plan components for lynx in the Kettle  
 2 Range. The forest plan designates the Kettle Range as occupied lynx habitat. The  
 3 forest plan states the Kettle Range is a lynx “core area” that “is important for the  
 4 recovery of Canada lynx in Washington.” The forest plan states that the Kettle  
 5 Range core area is an area with the strongest long-term evidence of lynx persistence  
 6 over time within the lower 48 States.

7           126. The Forest Service designated LAUs in the Kettle Range and  
 8 neighboring Wedge area. The forest plan states that habitat conditions for lynx will  
 9 be assessed at the LAU scale. There are 13 LAUs in the Kettle-Wedge “core areas.”

10

1           127. A LAU is the approximate size of a female’s home range. LAUs are used  
2 by the Forest Service to assess the effects on lynx and their habitat. LAUs are only  
3 designated in areas occupied by lynx. The Forest Service used the 2013 Lynx  
4 Assessment to delineate LAUs in the Kettle Range.

5           128. Some components in the forest plan for lynx are premised on the  
6 location, size, and habitat conditions within LAUs.

7           129. The forest plan states that LAU boundaries in the Kettle Range can be  
8 adjusted based on scientific literature and coordination with Fish and Wildlife  
9 Service (FW-GDL-WL-10). The 2013 Lynx Assessment states that LAUs are not to  
10 be adjusted for individual projects and must remain constant to be effective for their  
11 intended purposes of planning and monitoring.

12           130. In 2019, the Forest Service changed the LAU map for the Kettle Range.  
13 The Forest Service said the LAUs were “remapped” in 2019. The 2019 changes to  
14 the LAU maps changed LAU boundaries in the Kettle Range. The 2019 changes to  
15 the LAU maps combined some portions of LAUs with others. The 2019 changes to  
16 LAU maps removed areas from some LAUs. The 2019 changes to the LAUs  
17 combined the U.S. LAU with the Indian LAU.

1 *Declines in lynx numbers and range in the lower 48 States, Washington, and the*  
2 *Kettle Range “core area” since listing*

3 131. Lynx populations in the lower 48 States have declined since listing in  
4 2000. Lynx populations in Washington have declined since 2000. Lynx populations  
5 in the Kettle Range “core area” have declined since 2000.

6 132. The lynx’s range has contracted in the lower 48 States since 2000. The  
7 amount of available lynx habitat in the lower 48 States has declined since 2000. The  
8 lynx’s range and available habitat has declined in Washington since 2000. The lynx  
9 range and available habitat has declined in the Kettle Range “core area” since 2000.

10 133. Lynx numbers and range has declined in Washington since 2000 due to  
11 logging. Lynx numbers and range in Washington has declined since 2000 due to  
12 insect outbreaks. Lynx numbers and range in Washington has declined since 2000  
13 due to forest fires. Lynx numbers and range in Washington has declined since 2000  
14 due to climate change.

15 134. Wildfires in Washington have resulted in a decrease in lynx populations  
16 since 2000. Wildfires in Washington have decreased available lynx habitat in  
17 Washington since 2000. All six lynx management zones in Washington occur in fire-  
18 prone landscapes.

19 135. Since the 1980s, there has been a significant increase in large-wildfire  
20 frequency in the six lynx management zones. Wildfires can lead to the loss and

1 degradation of forest cover. Wildfires can lead to a loss of snowshoe hare  
2 populations. Lynx habitat likely does not recover from wildfires in Washington for  
3 roughly 35-40 years.

4 136. By 2017, the loss of lynx habitat in Washington due to forest fires  
5 reduced estimates of available lynx habitat to 3,800 sq. km.

6 137. By 2017, it was estimated that Washington's lynx habitat could only  
7 support approximately 38-61 lynx.

8 138. In 2020, it was estimated that only the Okanogan lynx management zone  
9 in Washington likely supported a resident, reproducing population of lynx.

10 139. The Vulcan-Trunk lynx management zone in Washington likely no  
11 longer supports a resident, reproducing population of lynx. Recent (2016 and 2017)  
12 surveys for lynx in the Vulcan-Trunk lynx management zone failed to detect any lynx  
13 presence.

14 140. The Wedge lynx management zone in Washington likely no longer  
15 supports a resident, reproducing population of lynx. Recent (2016 and 2017) surveys  
16 for lynx in the Wedge lynx management zone failed to detect any lynx presence.

17 141. The Little Pend Oreille lynx management zone in Washington likely no  
18 longer supports a resident, reproducing population of lynx.

1 142. The Salmo-Priest lynx management zone in Washington likely no longer  
2 supports a resident, reproducing population of lynx.

3 143. There is a lack of lynx population redundancy in Washington. Future  
4 forecasts reveal there is a strong potential for retraction of suitable lynx habitat in  
5 Washington.

6 144. The 2017 Species Assessment acknowledged that since listing, lynx have  
7 likely been extirpated or significantly reduced in size in Washington. Since listing,  
8 lynx have been extirpated in large portions of Washington. Since listing, lynx  
9 populations have been reduced in size in Washington. Since listing, lynx habitat has  
10 been reduced in size in Washington.

11 145. The Fish and Wildlife Service does not have current information on lynx  
12 distribution in Washington. The Fish and Wildlife Service does not have current  
13 information on lynx population status in Washington.

14 146. Lynx in Washington are currently at risk of extirpation. Lynx in  
15 Washington are likely to become endangered in the foreseeable future.

16 147. Lynx presence remains in the Kettle Range. Lynx presence has declined  
17 in the Kettle Range “core” recovery area since 2000. The Kettle Range may no  
18 longer be a “stronghold” for lynx. It is uncertain whether Kettle Range still supports  
19 a resident, breeding population of lynx (or just individuals).

1           148. A camera trap survey from 2016-2017 documented three photos of a  
2 lynx in the Kettle Range.

3           149. In 2018, a camera trapping effort was launched in the Kettle Range. This  
4 effort detected at least one lynx in the area.

5           150. During the winter of 2020, lynx tracks were reported in the Kettle Range  
6 and later confirmed by Forest Service and Washington DNR biologists.

7           151. There are on-going efforts to recover and reintroduce additional lynx to  
8 the Kettle Range.

9           152. The Confederated Tribes of the Colville Reservation, including the  
10 Confederated Tribe's Fish and Wildlife Department, in partnership with  
11 Conservation Northwest, Upper Columbia United Tribes, the Okanagan Nation  
12 Alliance, and others have been capturing lynx in Canada and relocating them to the  
13 Colville Indian Reservation in the Kettle Mountains.

1

2

3           153. The goal of the reintroduction effort is to help reestablish a stable and  
4 reproductive population of lynx within the entire Kettle Range. The plan is to trap

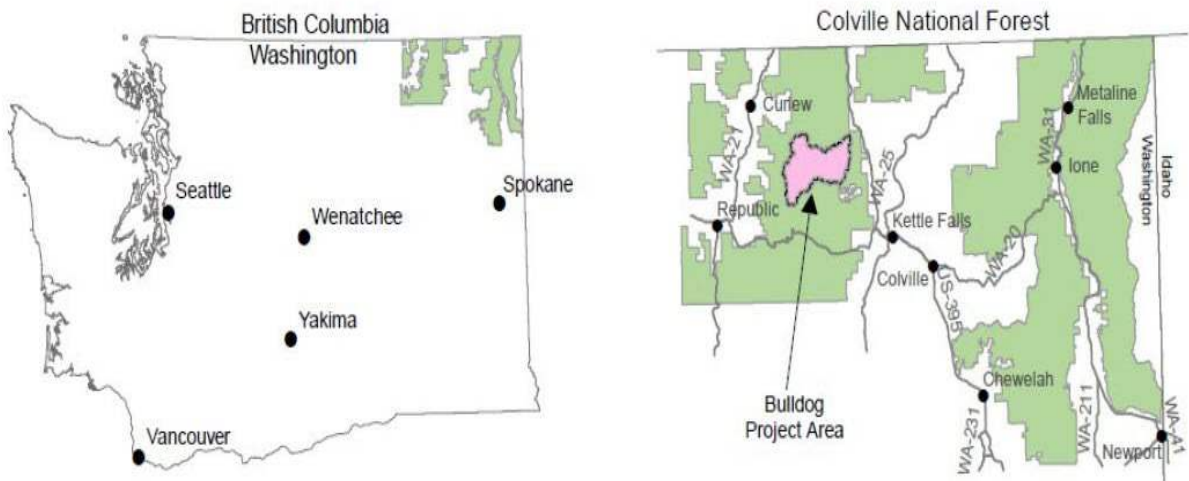

1 and relocate up to 50 lynx from Canada into the Kettle Range over the next five  
2 years, until 2026.

3 154. By February 2022, nine adult lynx were released into the Kettle Range.  
4 In November 2022 an additional ten lynx were released into the Kettle Range. At  
5 least one of the female lynx reintroduced into the Kettle Range reproduced and has  
6 been documented with a kitten. The Confederated Tribe of the Colville  
7 Reservation’s Fish and Wildlife Department is continuing to monitor lynx  
8 occupancy in the Kettle Range, including possible evidence of reproduction.

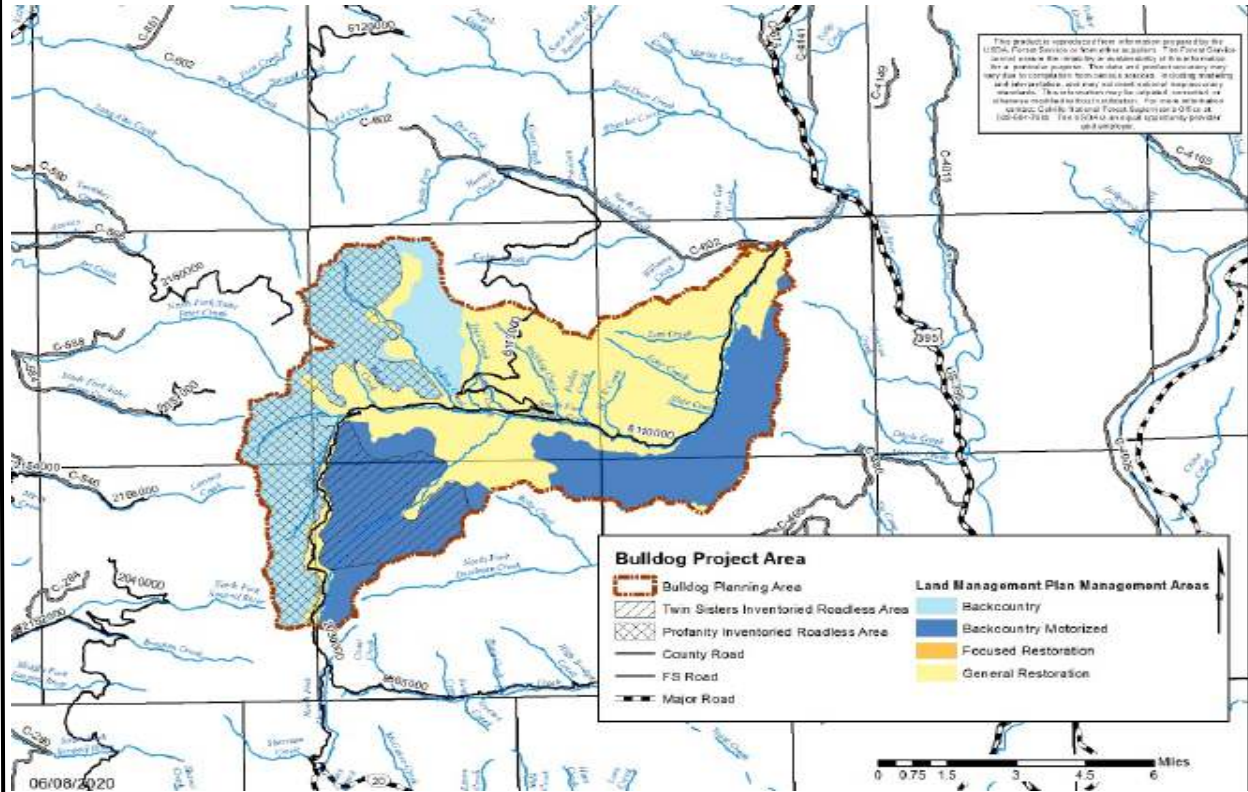

9 ***The Bulldog project***

10 155. On April 28, 2022, the Forest Service authorized the Bulldog project in  
11 the Kettle Range “core area” for lynx recovery.

12 156. The Bulldog project is located in the Colville National Forest, about 15  
13 miles north and west of Kettle Falls, Washington in Ferry County.

1 157. The project area for the Bulldog project is roughly 44,000 acres in size.  
2 The project area is located in the Three Rivers Ranger District of the Colville  
3 National Forest.

4  
5 158. The Bulldog project area contains boreal forest landscapes with sufficient  
6 snowshoe hare densities and winter snow.

7 159. The Bulldog project area includes subalpine fir forests. The Bulldog  
8 project area is primarily a Northern Rocky Mountain mixed conifer forest. The  
9 Bulldog project area includes mature, multi-storied forest with dense horizontal  
10 cover.

1 160. Forest stands in the Bulldog project area experience winter conditions  
2 with deep snow for extended periods of time, include sites for denning such as  
3 downed trees and root wads. Forest stands in the project area include matrix habitat  
4 allowing lynx to travel between patches of boreal forest.

5 161. The Bulldog project area is located within occupied lynx habitat. Lynx  
6 have been documented in the project area. The project area is located within the  
7 Kettle Range “core area” for lynx recovery.

8 162. The Bulldog project is located within LAUs.

9 163. Prior to the 2019 changes to the LAU boundaries, the Bulldog project  
10 was located in multiple LAUs. Prior to the 2019 changes to the LAU boundaries,  
11 the Bulldog project was located in the Indian LAU, U.S. LAU and Deadman LAU.

12 164. After the 2019 changes to the LAU boundaries, the Bulldog project is  
13 now located only in the U.S. LAU.

14 165. The Bulldog project was previously located in the Indian LAU. The  
15 Bulldog project was previously located in the Deadman LAU.

16 166. The Forest Service changed the LAU boundaries to bring the Bulldog  
17 project into compliance with forest plan components for lynx.

18 167. The Bulldog project would not comply with forest plan components for  
19 lynx in the Indian LAU.

1 168. The U.S. LAU is 26,518 acres in size. Roughly 5 percent of the U.S.  
2 LAU is considered “non-lynx habitat.” Roughly 95 percent of the U.S. LAU in the  
3 Kettle Range is considered lynx habitat or habitat capable of supporting lynx.

4 169. The project area for the Bulldog project extends beyond the U.S. LAU.  
5 Logging for the Bulldog project extends beyond the U.S. LAU. Portions of the  
6 project area located outside the U.S. LAU are designated occupied lynx habitat.  
7 Lynx have been documented in portions of the project area located outside the U.S.  
8 LAU.

9 170. The Forest Service prepared an environmental assessment (“EA”) for the  
10 Bulldog project.

11 171. The EA cites and references the 2013 Lynx Assessment. The EA  
12 considers the 2013 Lynx Assessment to be the best available science on lynx, lynx  
13 habitat, and threats to the species.

14 172. The EA does not disclose changes made to LAUs in the Bulldog project  
15 area. The EA does not analyze or explain why changes were made to LAUs in the  
16 Bulldog project area. The EA does not explain what the changes to the LAUs were  
17 in the project area.

18 173. The EA does not cite or reference the best available science on lynx and  
19 threats to lynx in Washington or the Kettle Range.

1 174. The EA does not cite or reference the 2017 Status Assessment. The Fish  
2 and Wildlife Service considers the 2017 Status Assessment to be the best available  
3 science on lynx, lynx habitat, and threats to the species. The lynx status assessment  
4 is the best available science on lynx, lynx habitat, and threats to the species.

5 175. In August 2021, the Bulldog Mountain fire burned 5,490 acres.

6 176. The Bulldog fire burned the eastern portion of the 44,000-acre Bulldog  
7 project area. The Forest Service has not prepared a report or otherwise documented  
8 and informed the public what changes it made to the project in response to the  
9 Bulldog Mountain fire. The Bulldog Mountain fire alleviated the need for vegetative  
10 and fuel treatments in the burned area.

11 177. The Bulldog Mountain fire altered the amount of available lynx habitat  
12 in the U.S. LAU. The Bulldog Mountain fire altered the amount of available lynx  
13 habitat in the Indian LAU. The Bulldog Mountain fire burned lynx habitat. The  
14 Bulldog Mountain fire harmed lynx. The Bulldog Mountain fire damaged lynx  
15 habitat. The Bulldog Mountain fire damaged lynx foraging habitat. The Bulldog  
16 Mountain fire damaged lynx denning habitat. The Bulldog Mountain fire displaced  
17 lynx from the Kettle Range. The Bulldog Mountain fire created an unsuitable  
18 habitat for lynx.

1 178. Since 2000, there have been other large wildfires in the Kettle Range  
2 that have also created unsuitable habitat for lynx. The Renner fire burned in lynx  
3 habitat in the Kettle Range. The Graves Mountain fire burned in lynx habitat in the  
4 Kettle Range. The Togo Mountain fire burned in lynx habitat in the Kettle Range.  
5 The Copper Butte fire burned in lynx habitat in the Kettle Range. The Mt. Leona  
6 fire burned in lynx habitat in the Kettle Range. The Stickpin fire burned lynx  
7 habitat in the Kettle Range.

8 179. From 1990-2002 roughly 2,600 square kilometers of lynx habitat burned  
9 in Washington. In 2014 alone, roughly 1,600 square kilometers of lynx habitat in  
10 Washington burned.

11 180. The Forest Service made changes to the EA for the Bulldog project after  
12 the Bulldog Mountain fire burned the eastern portion of the project area.

13 181. On April 28, 2022, the Forest Service signed a final decision approving  
14 the Bulldog project.

15 182. The Bulldog project allows for the logging of old and large trees over 20  
16 inches in diameter at breast height (referred to as “dbh”). Large trees can be logged if  
17 they are in campgrounds or 200 feet of open roads. Large trees can be logged if they  
18 are along prescribed fire control features. Large trees that are between 20 and 25  
19 inches dbh can be logged if they are within 50 feet of large Ponderosa Pine. Large

1 trees between 20 and 25 inches dbh can be logged if they are within 50 feet of large  
2 Western Larch or Douglas Fir and when prescribed fire is planned for the stand.  
3 Large trees between 20 and 25 inches dbh can be logged if they are within 100 feet  
4 of aspen clumps.

5 183. The Bulldog project includes commercial logging within lynx habitat in  
6 the Kettle Range. The project includes roughly 7,014 acres of the project area that  
7 will be subject to commercial logging. The project includes roughly 342 acres of  
8 commercial thinning. The project includes roughly 202 acres of “shelterwood  
9 removal with reserves.” The project includes commercial “regeneration harvests.”

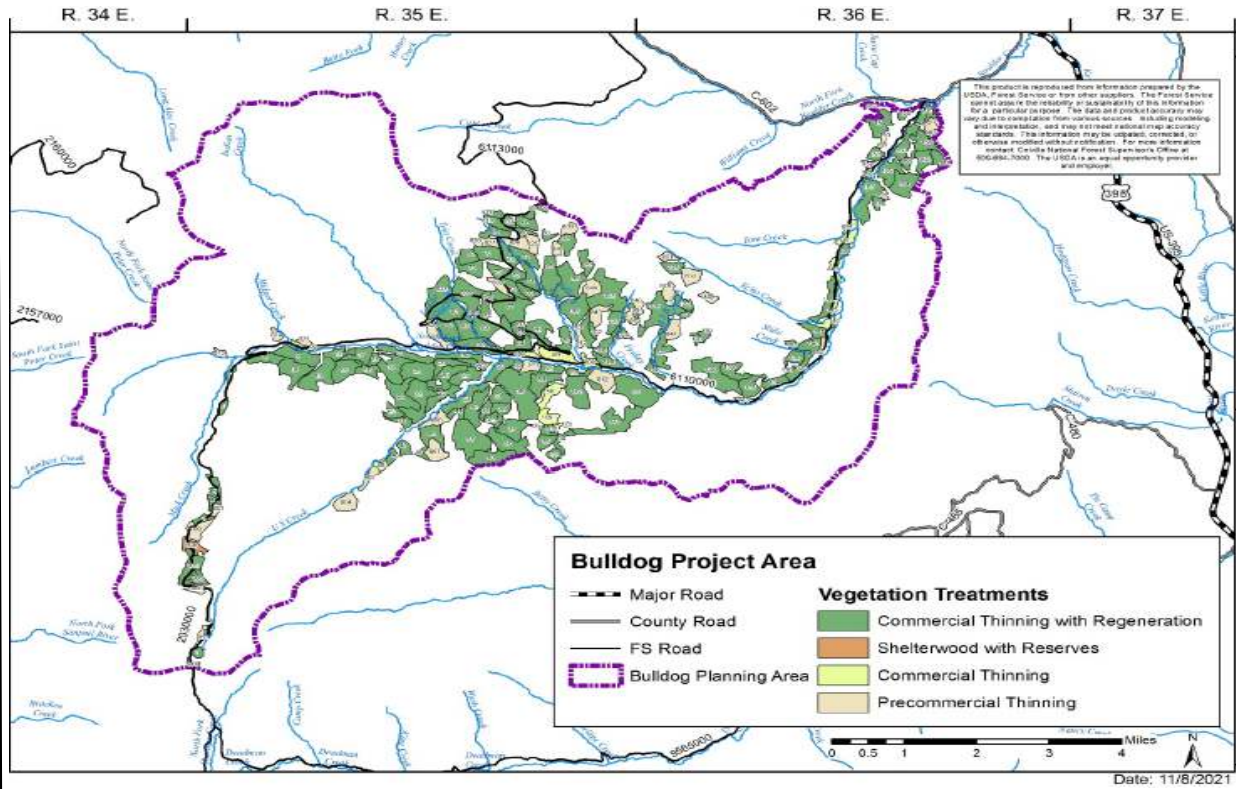

10 184. Commercial logging for the Bulldog project will involve cutting and  
11 removing conifer trees 5 inches and larger dbh. Cut trees will be dragged or “yarded”  
12 to landing areas using skidders or forwarders and then hauled away by logging  
13 trucks. The project includes no requirement for reforestation or replanting after  
14 commercial logging. The Forest Service said reforestation or replanting after  
15 commercial logging will be “evaluated post-harvest.”

16 185. Commercial logging for the Bulldog project will harm lynx habitat.  
17 Commercial logging for the Bulldog project will remove horizontal cover.  
18 Commercial logging for the Bulldog project will create unsuitable habitat conditions  
19 for lynx.

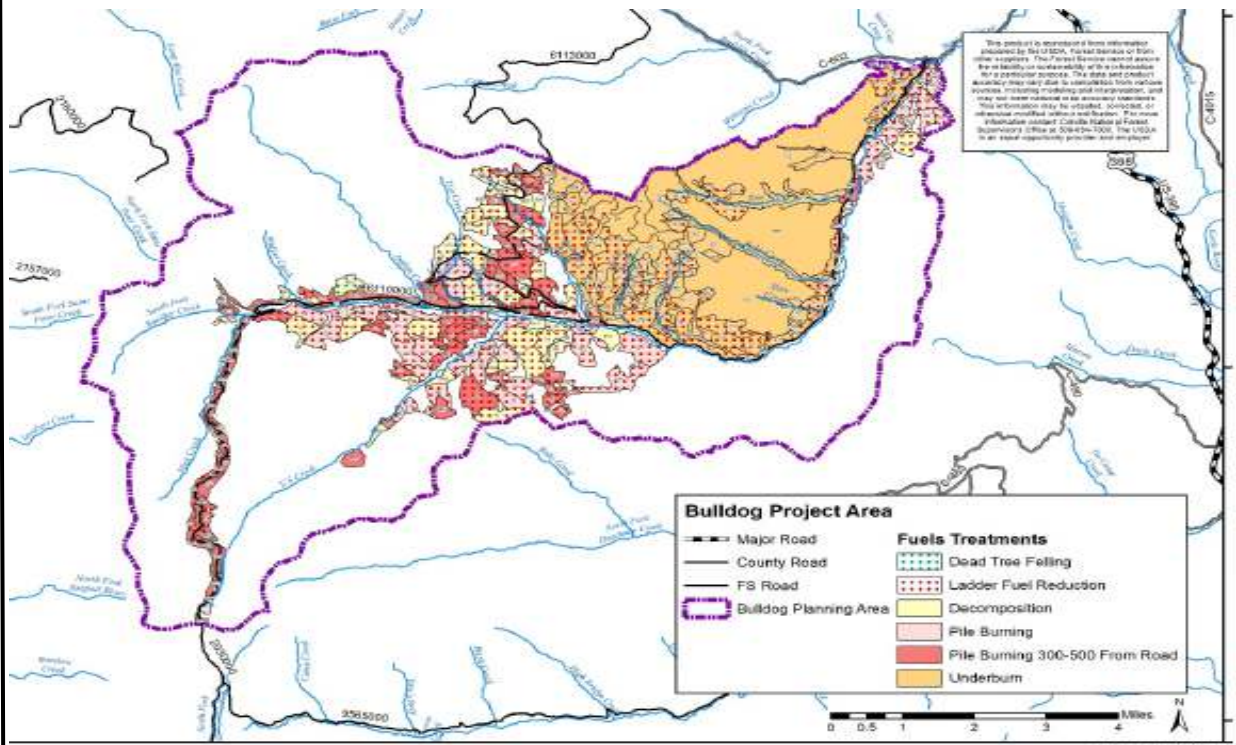

1 186. The Bulldog project includes non-commercial logging in lynx habitat in  
2 the Kettle Range. Non-commercial logging includes pre-commercial thinning, ladder  
3 fuel reduction, and dead tree felling. Ladder fuel reductions involve cutting the  
4 understory trees that are growing under the dripline of an overstory tree.

5 187. Non-commercial logging for the Bulldog project will harm lynx habitat.  
6 Non-commercial logging for the Bulldog project will remove horizontal cover. Non-  
7 commercial logging for the Bulldog project will create unsuitable habitat conditions  
8 for lynx.

9 188. The Bulldog project includes prescribed burning in lynx habitat in the  
10 Kettle Range. The project includes 8,243 acres of underburning. Underburning  
11 involves igniting fuels at a measured pace during predetermined burning conditions.  
12 The project includes 2,431 acres of piling and pile burning. Piling and burning  
13 involves gathering limbs, tops, and whips and slash and existing woody debris and  
14 burning when conditions allow. The project includes 2,441 acres piling and burning  
15 within 500 feet of roads. The project includes 1,981 acres of “lop and scatter.” These  
16 prescriptions will remove horizontal cover. These prescriptions will create unsuitable  
17 habitat conditions for lynx.

1

2

1 189. The Bulldog project includes new road work and road building in lynx  
2 habitat. The Bulldog project includes building approximately 9 miles of new,  
3 temporary roads to access the commercial logging units. The project involves  
4 rerouting existing roads.

5 190. The Bulldog project will be implemented over 10-15 years. In the EA,  
6 the Forest Service states that lynx will be displaced from the area during project  
7 activities.

8 191. In the EA, the Forest Service states that logging for the Bulldog project  
9 will reduce “horizontal cover for lynx” and create an “influx of unsuitable habitat for  
10 the next 20-40 years.”

11 192. In the EA, the Forest Service states that logging for the Bulldog project  
12 will remove roughly 888 acres of early-stage forage habitat for snowshoe hares. This  
13 treatment will create unsuitable habitat conditions for lynx. This treatment will  
14 create unsuitable habitat conditions for 20-40 years.

15 193. The EA states that the Bulldog project will result in 13 percent of the  
16 U.S. LAU becoming unsuitable lynx habitat.

17 194. The EA states that 15 percent of the potential denning habitat in the  
18 U.S. LAU is proposed for treatment and will become unsuitable lynx habitat. The  
19 EA states that commercial and fuel thinning treatments for the Bulldog project will

1 turn denning habitat into unsuitable habitat for approximately 35-40 years through  
2 the reduction in down woody debris.

3 195. The EA states that there will be deficient habitat connectivity along  
4 Albion Hill Road due to the Bulldog project.

5 196. The EA states the Bulldog project will result in 3,679 acres of unsuitable  
6 habitat that will remain unsuitable for up to 40 years.

7 197. The Forest Service limited its analysis of likely effects to lynx from the  
8 Bulldog project to the U.S. LAU. The Forest Service did not consider or analyze  
9 effects to lynx in the Indian LAU. The Forest Service restricted in analysis of the  
10 likely effects to lynx to the next 40 years. The Forest Service did not consider or  
11 analyze the effects to lynx in the Kettle Range “core area” for lynx recovery. The Fish  
12 and Wildlife Service did not consider or analyze the effects to lynx in the Kettle  
13 Range “core area” for lynx recovery.

14 198. The Forest Service determined that the Bulldog project would not have a  
15 significant effect on the environment.

16 199. The Forest Service issued a “finding of no significant impact” for the  
17 Bulldog project.

18 200. The Forest Service never surveyed the project area for lynx or lynx  
19 habitat before approving the Bulldog project. The Forest Service never surveyed the

1 project area for lynx or lynx habitat before issuing its finding of no significant  
2 impacts.

3 201. The Forest Service prepared a biological assessment for the Bulldog  
4 project.

5 202. In the biological assessment, the Forest Service determined that Bulldog  
6 project “may affect, not likely to adversely affect” lynx. The Forest Service recognized  
7 that the Bulldog project will create unsuitable habitat conditions for lynx over the  
8 next 20-40 years but said conditions will improve after that timeframe. The Forest  
9 Service said the project is consistent with the forest plan’s standards and guidelines.  
10 The Forest Service said there are no known lynx “den sites” in the project area.

11 203. The Forest Service never surveyed the project area for lynx before issuing  
12 its “may affect, not likely to adversely affect” determination on lynx. The Forest  
13 Service never surveyed for lynx den sites in the project area. The Forest Service never  
14 reviewed or consulted the 2017 Lynx Status Assessment before issuing its “may  
15 affect, not likely to adversely affect” determination on lynx.

16 204. The Fish and Wildlife Service concurred with the Forest Service’s “may  
17 affect, not likely to adversely affect” finding on lynx on two occasions. The Fish and  
18 Wildlife first concurred on March 19, 2021, before the Bulldog Mountain fire.

1 After the Bulldog Mountain fire, the Forest Service submitted a new biological  
2 assessment to the Fish and Wildlife Service for review of its renewed “may affect, not  
3 likely to adversely affect” finding on lynx.

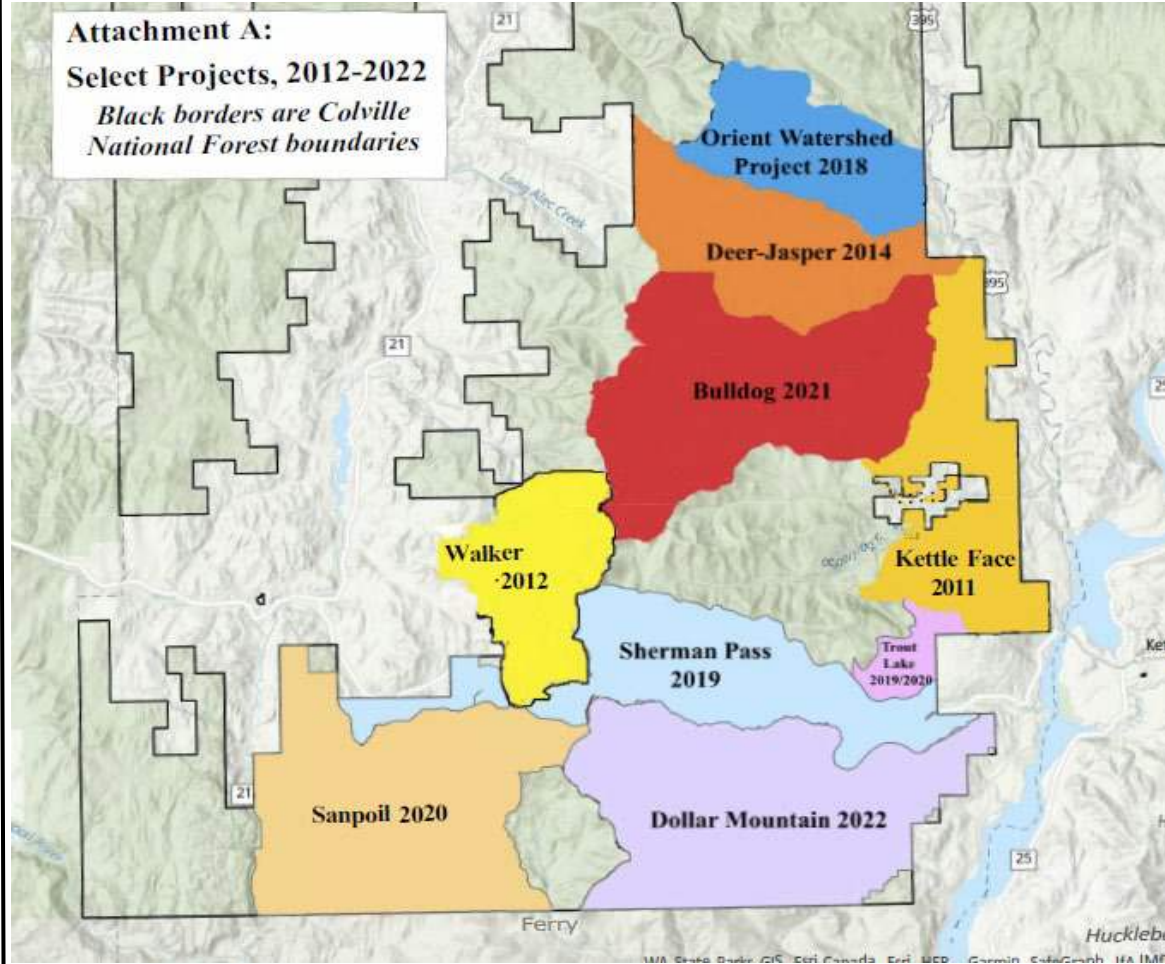

4 205. The Fish and Wildlife Service provided final concurrence with the Forest  
5 Service’s “may affect, not likely to adversely affect” finding on lynx on February 7,  
6 2022. The Fish and Wildlife Service’s rationale remained the same.

7 206. The Fish and Wildlife Service never surveyed the project area for lynx  
8 before concurring with the Forest Service’s “may affect, no likely to adversely affect”  
9 finding on lynx. The Fish and Wildlife Service never reviewed or consulted the  
10 2017 Lynx Status Assessment before concurring on the Forest Service’s “may affect,  
11 not likely to adversely affect” determination on lynx.

12 207. Over the past ten years, the Forest Service has approved at least eight  
13 other logging projects in the Kettle Range and “core area” for lynx recovery. The  
14 Forest Service approved the Orient Watershed project in 2018. The Forest Service  
15 approved the Deer-Jasper project in 2014. The Forest Service approved the Kettle  
16 Face project in 2011. The Forest Service approved the Walker project in 2012. The  
17 Forest Service approved the Sherman Pass project in 2019. The Forest Service  
18 approved the Trout Lake project in 2019. The Forest Service approved the Sherman

1 Pass project in 2019. The Forest Service approved the Sanpoil project in 2020. The  
2 Forest Service approved the Dollar Mountain project in 2022.

**FIRST CAUSE OF ACTION**  
**(Violation of the ESA – arbitrary “not likely to adversely affect”  
determination)**

208. The Kettle Range Conservation Group incorporates all preceding paragraphs.

209. Section 7 of the ESA requires the Forest Service to consult with the Fish and Wildlife Service on how the proposed Bulldog project “may affect” listed

1 species, including threatened lynx. 16 U.S.C. § 1536(a)(2). “May affect” is the  
2 appropriate conclusion during consultation when a proposed action may pose *any*  
3 effects on listed species.

4 210. The purpose of Section 7 consultation is to ensure the Forest Service’s  
5 Bulldog project is not likely to “jeopardize” the continued existence of lynx. 16  
6 U.S.C. § 1536(a)(2). Section 7 of the ESA imposes a substantive duty on the Forest  
7 Service to ensure the Bulldog project does not jeopardize the continued existence of  
8 listed species, including lynx. *Id.* “Jeopardize the continued existence of” means “to  
9 engage in an action that reasonably would be expected, directly or indirectly, to  
10 reduce appreciably the likelihood of both the survival and recovery of a listed species  
11 in the wild by reducing the reproduction, numbers, or distribution of that species.

12 50 C.F.R. § 402.02

13 211. Under Section 7 of the ESA, if the Forest Service determines that its  
14 authorization of the Bulldog project is “not likely to adversely affect” a listed species  
15 and the Fish and Wildlife Service concurs with this finding, then consultation is  
16 concluded. The Fish and Wildlife Service explains that a “not likely to adversely  
17 affect” determination is only appropriate when the “effects on listed species are  
18 expected to be discountable, insignificant, or completely beneficial.”

1           212. Under Section 7 of the ESA, if the Forest Service determines its  
2 authorization of the Bulldog project is “likely to adversely affect” a listed species,  
3 then the Fish and Wildlife Service must prepare a biological opinion to determine  
4 whether the action is likely to jeopardize the continued existence of the listed  
5 species. 16 U.S.C. § 1536(b)(3); 50 C.F.R. § 402.14.

6           213. If the Fish and Wildlife Service issues a “no jeopardy” finding in its  
7 biological opinion, it must specify reasonable and prudent measures, and terms and  
8 conditions, to minimize the impact of any incidental take resulting from the action.  
9 50 C.F.R. § 402.14. The Fish and Wildlife Service must also specify the amount or  
10 extent, and effects, of any incidental take that is anticipated by the proposed action.

11 *Id.*

12           214. The Forest Service prepared a biological assessment for the Bulldog  
13 project to evaluate its effect on listed species, including lynx. The Forest Service  
14 determined that the project was “not likely to adversely affect” lynx. The Fish and  
15 Wildlife Service concurred with the Forest Service’s determination that the Bulldog  
16 project is “not likely to adversely affect” lynx. The Fish and Wildlife Service’s  
17 concurrence completed Section 7 consultation for the Bulldog project. The Fish and  
18 Wildlife Service’s concurrence alleviated the need for the agency to prepare a  
19 biological opinion.

1           215. When consulting on the Bulldog project, the Forest Service and Fish and  
2 Wildlife Service failed to properly evaluate the likely direct, indirect, and cumulative  
3 effects of the project on lynx, lynx habitat, connectivity, or lynx recovery.

4           216. When consulting on the Bulldog project, the Forest Service and Fish and  
5 Wildlife Service failed to properly define and evaluate the effects of the project in  
6 the “action area.” The “action area” means “all areas to be affected directly or  
7 indirectly by the Federal action and not merely the immediate area involved in the  
8 action.” C.F.R. § 402.02

9           217. When consulting on the Bulldog project, the Forest Service and Fish and  
10 Wildlife Service failed to properly define and evaluate the “environmental baseline.”  
11 The “environmental baseline” is the condition of listed species before the proposed  
12 action. 50 C.F.R. § 402.02. The baseline includes “the past and present impacts of  
13 all Federal, State, or private actions and other human activities in the action area,  
14 the anticipated impacts of all proposed Federal projects in the action area that have  
15 already undergone formal or early section 7 consultation, and the impact of State or  
16 private actions which are contemporaneous with the consultation in process.” *Id.*

17           218. When consulting on the Bulldog project, the Forest Service and Fish and  
18 Wildlife Service failed to properly define and evaluate the “cumulative effects.”  
19 Under Section 7, the “cumulative effects” are “those effects of future State or private

1 activities, not involving Federal activities that are reasonably certain to occur within  
2 the action area.” 50 C.F.R. § 402.02.

3 219. When consulting on the Bulldog project, the Forest Service and Fish and  
4 Wildlife Service failed to properly define and evaluate the entire “effects of the  
5 action,” including all aspects of the Bulldog project. The “effects of the action” are  
6 all the consequences that are caused by the action on listed species, including the  
7 “consequences of other activities that are caused by the proposed action.” 50 C.F.R.  
8 § 402.02.

9 220. When consulting on the Bulldog project, the Forest Service and Fish and  
10 Wildlife Service failed to add the “effects of the action” and “cumulative effects” to  
11 the “environmental baseline” in order to formulate its opinion about how the  
12 proposed project may affect listed species and whether it will result on a jeopardy  
13 finding. 50 C.F.R. § 402.14(g)(4).

14 221. The Forest Service’s determination that the Bulldog project is “not likely  
15 to adversely affect” lynx and the Fish and Wildlife Service’s concurrence with that  
16 determination is “arbitrary, capricious, an abuse of discretion, or otherwise not in  
17 accordance with law” and/or constitutes “agency action unlawfully withheld or  
18 unreasonably delayed.” 5 U.S.C. §§ 706 (2)(A) and 706(1).

19 **SECOND CAUSE OF ACTION**  
20 **(Violation of the ESA – best available science)**

1 222. The Kettle Range Conservation Group incorporates all preceding  
2 paragraphs.

3 223. Section 7 of the ESA requires the Forest Service to consult with the Fish  
4 and Wildlife Service on how the Bulldog project may affect lynx. 16 U.S.C. §  
5 1536(a)(2). Consultation under Section 7 of the ESA and all related findings and  
6 analyses must be based solely on the best scientific and commercial data available  
7 (“best available science”). 16 U.S.C. § 1536(a)(2).

8 224. The Forest Service’s biological assessment and related effects analysis and  
9 finding that the Bulldog project was “not likely to adversely affect” lynx, and the Fish  
10 and Wildlife Service’s concurrence with that finding, failed to use and apply the best  
11 available science on lynx, threats to lynx and lynx habitat and connectivity, and  
12 recovery of lynx in the Kettle Range “core” recovery area, Washington, and within  
13 the lower 48 States.

14 225. The Forest Service’s and the Fish and Wildlife Service’s failure to use  
15 and apply the best available science when consulting on the Bulldog project is  
16 “arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with  
17 law” and/or constitutes “agency action unlawfully withheld or unreasonably  
18 delayed.” 5 U.S.C. §§ 706 (2)(A) and 706(1).

19 **THIRD CAUSE OF ACTION**  
20 **(Violation of the NFMA – lynx habitat)**

1           226. The Kettle Range Conservation Group incorporates all preceding  
2 paragraphs.

3           227. NFMA directs that all site-specific projects be consistent with the forest  
4 plan. 16 U.S.C. § 1604(i).

5           228. The 2019 Colville Forest plan includes a number of forest plan  
6 components (i.e., desired conditions, objectives, standards, and guidelines) to ensure  
7 sufficient and adequate lynx habitat remains in the Kettle Range. Most of these  
8 forest plan components rely on LAU boundaries.

9           229. The forest plan states that all forest plan management direction will be  
10 consistent with “existing recovery plans” for federally listed species, including lynx.

11           230. The forest plan states that the Forest Service should ensure habitat  
12 conditions in the Kettle Range contribute to the recovery of federally listed species,  
13 including lynx (FW-DC-WL-02).

14           231. The forest plan states that habitat conditions for threatened species  
15 (including lynx), including the amount, distribution and connectivity of habitat in  
16 the forest, are to be consistent with the historic range of variability (FW-DC-WL-02).

17           232. The forest plan states that forest successional stages within LAUs will  
18 provide a mosaic of lynx habitat (including foraging, travel, and denning) with a

1 landscape pattern that is consistent with the historic range of variability (FW-DC-  
2 WL-04).

3 233. The forest plan states that during the expected 15 years of forest plan  
4 implementation, it will aim to restore an average of a 100 acres per year of snowshoe  
5 hare and/or lynx habitat within LAUs in the Kettle Range (FW-OBJ-WL-02).

6 234. The forest plan states that projects shall not reduce horizontal cover  
7 (snowshoe hare habitat) in late-closed structure subalpine fir/lodgepole or  
8 spruce/subalpine fir forests in the Kettle Range, unless certain exceptions are met  
9 (FW-STD-WL-02). The forest plan states that LAUs must be used to measure  
10 changes to lynx habitat.

11 235. The forest plan states that the Forest Service cannot change more than  
12 15 percent of lynx habitat within any single LAU to an unsuitable condition in the  
13 Kettle Range in any 10-year period (FW-STD-WL-03).

14 236. The forest plan states that, subject to some exceptions, there can be no  
15 net increase in groomed or designated over-the-snow routes into lynx habitat at the  
16 LAU scale in the Kettle Range (FW-STD-WL-04).

17 237. The forest plan states that when conducting vegetation management of  
18 coniferous vegetation in the Kettle Range, the suitability of lynx habitat with a LAU

1 shall not be reduced below 70 percent of the area that is capable of providing  
2 suitable lynx habitat (subalpine fir-associated forest types) (FW-STD-WL-05).

3 238. The forest plan states that a minimum of 20 percent of “untreated  
4 patches” and tree stem densities not less than 500 trees per acre in early structure  
5 vegetation types must be maintained within LAUs in the Kettle Range (FW-STD-  
6 WL-06).

7 239. The forest plan states vegetation management activities in LAUs in the  
8 Kettle Range should be focused in areas of poor snowshoe hare habitat (FW-GDL-  
9 WL-05).

10 240. The forest plan states that habitat for alternative prey species for lynx,  
11 primarily red squirrel, should be available in each LAU in the Kettle Range by  
12 providing cone-bearing late, closed structure conifer forest with coarse woody debris  
13 and snags and downed wood (FW-GDL-WL-06).

14 241. The forest plan states that the expansion or new construction of  
15 recreation and administrative facilities within LAUs in the Kettle Range should be  
16 located in, or adjacent to, existing areas of development, rather than creating new  
17 developed recreation or administrative sites (FW-GDL-WL-07).

18 242. The forest plan states that road reconstruction that results in increased  
19 traffic speed and volume should be avoided within LAUs in the Kettle Range and

1 that new permanent roads should not be located on forested ridge tops, saddles,  
2 close to forest stringers, or in other areas important for habitat connectivity in the  
3 Kettle Range (FW-GDL-WL-08).

4 243. The forest plan states that large, permanent openings should not be  
5 created in prey habitat within LAUs in the Kettle Range to contribute to habitat  
6 connectivity (FW-GDL-WL-09).

7 244. In approving the Bulldog project, the Forest Service failed to analyze,  
8 discuss, and demonstrate compliance with these forest plan components for lynx.

9 245. In approving the Bulldog project, the Forest Service changed, modified,  
10 and/or combined LAU boundaries which made it impossible to analyze and  
11 evaluate and demonstrate compliance with forest plan components for lynx.

12 246. The Forest Service's failure to analyze, demonstrate and ensure  
13 compliance with forest plan components for lynx and lynx habitat is "arbitrary,  
14 capricious, an abuse of discretion, or otherwise not in accordance with law" and/or  
15 constitutes "agency action unlawfully withheld or unreasonably delayed." 5 U.S.C.  
16 §§ 706 (2)(A) and 706(1).

17 247. The Forest Service's approval of the Bulldog project is inconsistent with  
18 forest plan components for lynx. The Bulldog project violates forest plan standards  
19 and guidelines for lynx and lynx habitat.

1 248. The Forest Service failure to comply with forest plan standards and  
2 guidelines for lynx and lynx habitat is “arbitrary, capricious, an abuse of discretion,  
3 or otherwise not in accordance with law” and/or constitutes “agency action  
4 unlawfully withheld or unreasonably delayed.” 5 U.S.C. §§ 706 (2)(A) and 706(1).

5 **FOURTH CAUSE OF ACTION**  
6 **(Violation of NEPA – effects)**

7 249. The Kettle Range Conservation Group incorporates all preceding  
8 paragraphs.

9 250. NEPA requires the Forest Service to adequately disclose, consider, and  
10 analyze the direct, indirect, and cumulative effects of its proposed actions. 42 U.S.C.  
11 § 4332 (C); 40 C.F.R. § 1502.16. The Forest Service must take a “hard look” at the  
12 effects of the action.

13 251. Direct effects are caused by the action and occur at the same time and  
14 place. Indirect effects are caused by the action and occur later in time or farther  
15 removed in distance but are reasonably foreseeable. Cumulative effects are the  
16 impacts on the environment that result from the incremental impact of the action  
17 when added to other past, present, and reasonably foreseeable future actions  
18 regardless of what agency (Federal or non-Federal) or person undertakes such other  
19 actions.

1           252. The Forest Service’s EA for the Bulldog project fails to adequately  
2 analyze the direct, indirect, and/or cumulative effects on lynx, lynx habitat,  
3 connectivity, or lynx recovery in the project area, the Kettle Range “core” area,  
4 Washington, or the lower 48 States. The Forest Service never considered the  
5 synergistic or combined effects to lynx from other logging projects in the area,  
6 wildlife fires, insect outbreaks, climate change, loss of connectivity and habitat  
7 fragmentation, human intrusions into lynx habitat, mortality, winter recreation and  
8 trail grooming, livestock grazing, and other threats to lynx. The Forest Service never  
9 analyzed (or disclosed) why and how it changed boundaries and combined LAUs  
10 and how they may affect lynx or management of lynx habitat in the project area or  
11 Kettle Range “core” area for lynx.

12           253. The Forest Service’s failure to analyze the direct, indirect, and cumulative  
13 effects to lynx, lynx habitat, connectivity and lynx recovery is “arbitrary, capricious,  
14 an abuse of discretion, or otherwise not in accordance with law” and/or constitutes  
15 “agency action unlawfully withheld or unreasonably delayed.” 5 U.S.C. §§ 706  
16 (2)(A) and 706(1).

17   **FIFTH CAUSE OF ACTION**  
18   **(Violation of NEPA – EIS required)**

19           254. The Kettle Range Conservation Group incorporates all preceding  
20 paragraphs.

1           255. NEPA requires the Forest Service to prepare an EIS for all “major federal  
2 actions significantly affecting the quality of the human environment.” 42 U.S.C. §  
3 4332(2)(C).

4           256. In deciding whether or not to prepare an EIS for the Bulldog project, the  
5 Forest Service used and relied on the pre-2020 NEPA regulations, 40 C.F.R. §  
6 1508.27.

7           257. In deciding whether or not to prepare an EIS, the Forest Service must  
8 consider both the context and intensity of the proposed action. 40 C.F.R. §  
9 1508.27. Context refers to the scope of the proposed action, including the interests  
10 affected. 40 C.F.R. § 1508.27(a). Assessing context requires that an action be  
11 analyzed in several contexts such as society as a whole (human, national), the  
12 affected region, the affected interests, and the locality, with both short- and long-  
13 term effects being relevant.

14           258. Intensity refers to the severity of the impact, and requires consideration  
15 of a number of factors, including: beneficial and adverse impacts; the degree to  
16 which the proposal affects public health and safety; unique characteristics of the  
17 geographic area, such as proximity to ecologically critical areas and cultural  
18 resources; the degree to which effects are likely to be controversial, highly uncertain,  
19 or involve unique or unknown risks; the precedential nature of the action; whether

1 the action is related to other actions with cumulatively significant impacts; and the  
2 degree of adverse effects on species listed as endangered or threatened under the  
3 ESA. 40 C.F.R. § 1508.27(b).

4 259. The Bulldog project has the potential to significantly affect public health  
5 or safety.

6 260. The Bulldog project will occur in an ecologically critical area, including  
7 the Kettle Range “core” area for lynx recovery which is one of the few remaining  
8 areas in the lower 48 States occupied by lynx. The project area is unique and  
9 essential to the conservation of lynx in the Kettle Range, Washington, and lower 48  
10 States. The Bulldog project is within WDFW’s lynx management zone and LAUs.  
11 The Bulldog project is in the Kettle Range, where efforts are underway to recover  
12 and reintroduce lynx.

13 261. The Bulldog project will occur in special management areas important  
14 for wildlife, including lynx. The Bulldog project will occur in Inventoried Roadless  
15 Areas.

16 262. The effects of the Bulldog project on lynx, lynx habitat and connectivity,  
17 and recovery in the Kettle Range, Washington, and lower 48 States are highly  
18 controversial, highly uncertain, and involve unique and unknown risks (given the  
19 lack of data and analysis presented in the EA or obtained by the Forest Service).

1           263. The purpose and need of the Bulldog project, including how the Forest  
2 Service defines the “historic range of variability” for the Kettle Range and project  
3 area and its prescriptions to achieve this “historic range of variability” are highly  
4 controversial and uncertain. The best available science reveals the Forest Service is  
5 mischaracterizing the “historic range of variability” in the project area and Kettle  
6 Range. The best available science reveals the Forest Service’s Bulldog project will  
7 move the forest away from “historic range of variability” and away from suitable  
8 habitat conditions for lynx (which historically occupied the area in large numbers).

9           264. The Forest Service’s decision to allow for the logging of old and large  
10 trees over 21 inches dba is highly controversial, highly uncertain, and involves  
11 unique and unknown risks (given the potential impacts to mature and old growth  
12 forest habitats relied on by a variety of species, including lynx). Cutting mature, old  
13 growth trees over 21 inches dbh represents a significant change and departure from  
14 the Forest Service’s previous 1995 21-inch rule prohibiting such logging of large  
15 trees in order protect mature, old growth habitat and biodiversity for various species,  
16 including lynx.

17           265. The Bulldog project will have cumulatively significant impacts on lynx,  
18 lynx habitat, connectivity, and recovery efforts in the Kettle Range, especially when  
19 evaluated in the context of other threats to the species, including climate change,

1 winter recreation and grooming, human-caused mortality, and loss of habitat from  
2 logging, fire, and insects.

3 266. The Bulldog project sets a dangerous precedent for how logging projects  
4 like this are conducted in the Kettle Range, an area important to and essential for  
5 lynx conservation.

6 267. In deciding not to prepare an EIS, the Forest Service failed to adequately  
7 consider and evaluate the significance factors.

8 268. The Forest Service's failure and/or decision not to prepare an EIS is  
9 "arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with  
10 law" and/or constitutes "agency action unlawfully withheld or unreasonably  
11 delayed." 5 U.S.C. §§ 706 (2)(A) and 706(1).

12 REQUEST FOR RELIEF

13 WHEREFORE, the Kettle Range Conservation Group respectfully request  
14 that this Court:

15 A. Declare the Forest Service violated and continues to violate the ESA,  
16 NFMA, and NEPA as alleged above;

17 B. Declare the Fish and Wildlife Service violated and continues to violate the  
18 ESA as alleged above;

19 C. Vacate the Forest Service's decision, related EA and Biological

1 Assessment, and any decisions, actions, permits or contracts implementing the  
2 portions of the Bulldog project challenged in this case pending compliance with the  
3 law;

4 D. Vacate the Fish and Wildlife Service's concurrence on the Forest Service's  
5 "not likely to adversely affect" finding for lynx;

6 E. Remand this matter back to the Forest Service and the Fish and Wildlife  
7 Service with instructions to comply with NEPA, NFMA and the ESA, as outlined  
8 herein and by this Court, including completion of new NEPA analysis analyzing the  
9 direct, indirect, and cumulative effects to lynx, preparation of an EIS, and  
10 completion of new, formal Section 7 consultation and the issuance of a biological  
11 opinion;

12 F. Award the Kettle Range Conservation Group their reasonable attorneys'  
13 fees, costs and expenses of litigation pursuant to Section 11(g) of the ESA, 16 U.S.C.  
14 § 1540(g) and/or the Equal Access to Justice Act ("EAJA"), 28 U.S.C. § 2412;

15 G. Issue any other relief, including preliminary or permanent injunctive relief,  
16 that the Kettle Range Conservation Group may subsequently request;

17 H. Issue any other relief this Court deems necessary, just, or proper.

Respectfully submitted this 12<sup>th</sup> day of May, 2023.
